

Phishing Simulation

In this exercise, I learned how phishing attacks work and how attackers can create fake login pages to capture user credentials.

I created a simple HTML login form and explored the Social Engineering Toolkit (SEToolkit) in Kali Linux.

Reflection

Characteristics of phishing pages

- suspicious or incorrect URLs
- fake login forms
- requests for sensitive information
- missing HTTPS certificate

Protection against phishing attacks

- checking URLs carefully
- avoiding suspicious links
- using two-factor authentication
- verifying website authenticity

Why are modern sites more secure?

Modern websites use HTTPS encryption, MFA, browser security protections, and anti-phishing systems that make attacks more difficult.
